# Deep Learning with torch:: CHEAT SHEET

torch is based on Pytorch, a framework popular among deep learning researchers.

torch's GPU acceleration allows to implement fast machine learning algorithms using its convenient interface, as well as a vast range of use cases, not only for deep learning, according to Its flexibility and its low level API.

It is part of an ecosystem of packages to interface with specific dataset like torchaudio for timeseries-like and torchvision for image-like data.

#### INSTALLATION

The torch R package uses the C++ libtorch library. You can install the prerequisites directly from R.

https://torch.mlverse.org/docs/articles/installation.html

```
install.packages("torch")
library(torch)
install_torch()
See ?install_torch for
GPU instructions
```

# Working with torch models

# DEFINE A NN MODULE dense ← nn\_module( "no\_biais\_dense\_layer", initialize = function(in\_f, out\_f) { self\$w ← nn\_parameter(torch\_randn(in\_f, out\_f)) }, forward = function(x) { torch\_mm(x, self\$w) } } Create a nn module names no\_biais\_dense\_layer

# **ASSEMBLE MODULES INTO NETWORK**

model ← dense(4, 3)
Instantiate a network from a single module

model ← nn\_sequential(
 dense(4,3), nn\_relu(), nn\_dropout(0.4),
 dense(3,1), nn\_sigmoid())
Instantiate a sequential network with multiple layers

#### **MODEL FIT**

model\$train()
Turns on gradient update

with\_enable\_grad({
 y\_pred ← model(trainset)
 loss ← (y\_pred - y)\$pow(2)\$mean()
 loss\$backward()
})
Detailed training loop step (alternative)

#### **EVALUATE A MODEL**

model\$eval()
or
with\_no\_grad({
 model(validationset)
})
Perform forward operation with no gradient update

#### **OPTIMIZATION**

optim\_sgd()
Stochastic gradient descent optimiser

optim\_adam()
ADAM optimiser

#### **CLASSIFICATION LOSS FUNCTION**

nn\_cross\_entropy\_loss()
nn\_bce\_loss()
nn\_bce\_with\_logits\_loss()
(Binary) cross-entropy losses
nn\_nll\_loss()
Negative log-likelihood loss
nn\_margin\_ranking\_loss()
nn\_hinge\_embedding\_loss()
nn\_multi\_margin\_loss()
nn\_multilabel\_margin\_loss()
(Multiclass) (multi label) hinge losses

# **REGRESSION LOSS FUNCTION**

nn\_ll\_loss()
L1 loss
nn\_mse\_loss()
MSE loss nn\_ctc\_loss()
Connectionist Temporal Classification loss
nn\_cosine\_embedding\_loss()
Cosine embedding loss
nn\_kl\_div\_loss()
Kullback-Leibler divergence loss
nn\_poisson\_nll\_loss()
Poisson NLL loss

# OTHER MODEL OPERATIONS

summary() Print a summary of a torch model

torch\_save(); torch\_load() Save/Load models to files

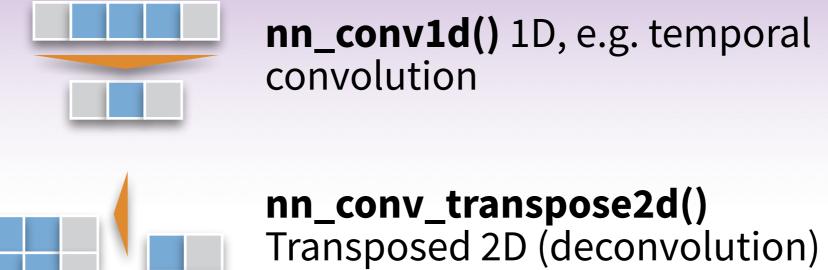

load\_state\_dict()
Load a model saved in python

# Neural-network layers

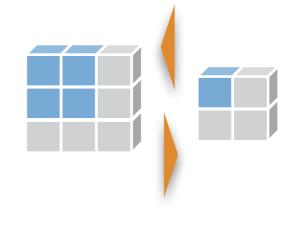

# CORE LAYERS nn\_linear() Add a linear transformation NN layer to an input nn\_bilinear() to two inputs nn\_sigmoid(), nn\_relu() Apply an activation function to an output nn\_dropout() nn\_dropout2d() nn\_dropout3d() Applies Dropout to the input

nn\_batch\_norm1d()
nn\_batch\_norm2d()
nn\_batch\_norm3d()
Applies batch normalisation to the weights

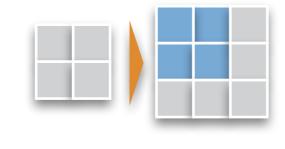

## **CONVOLUTIONAL LAYERS**

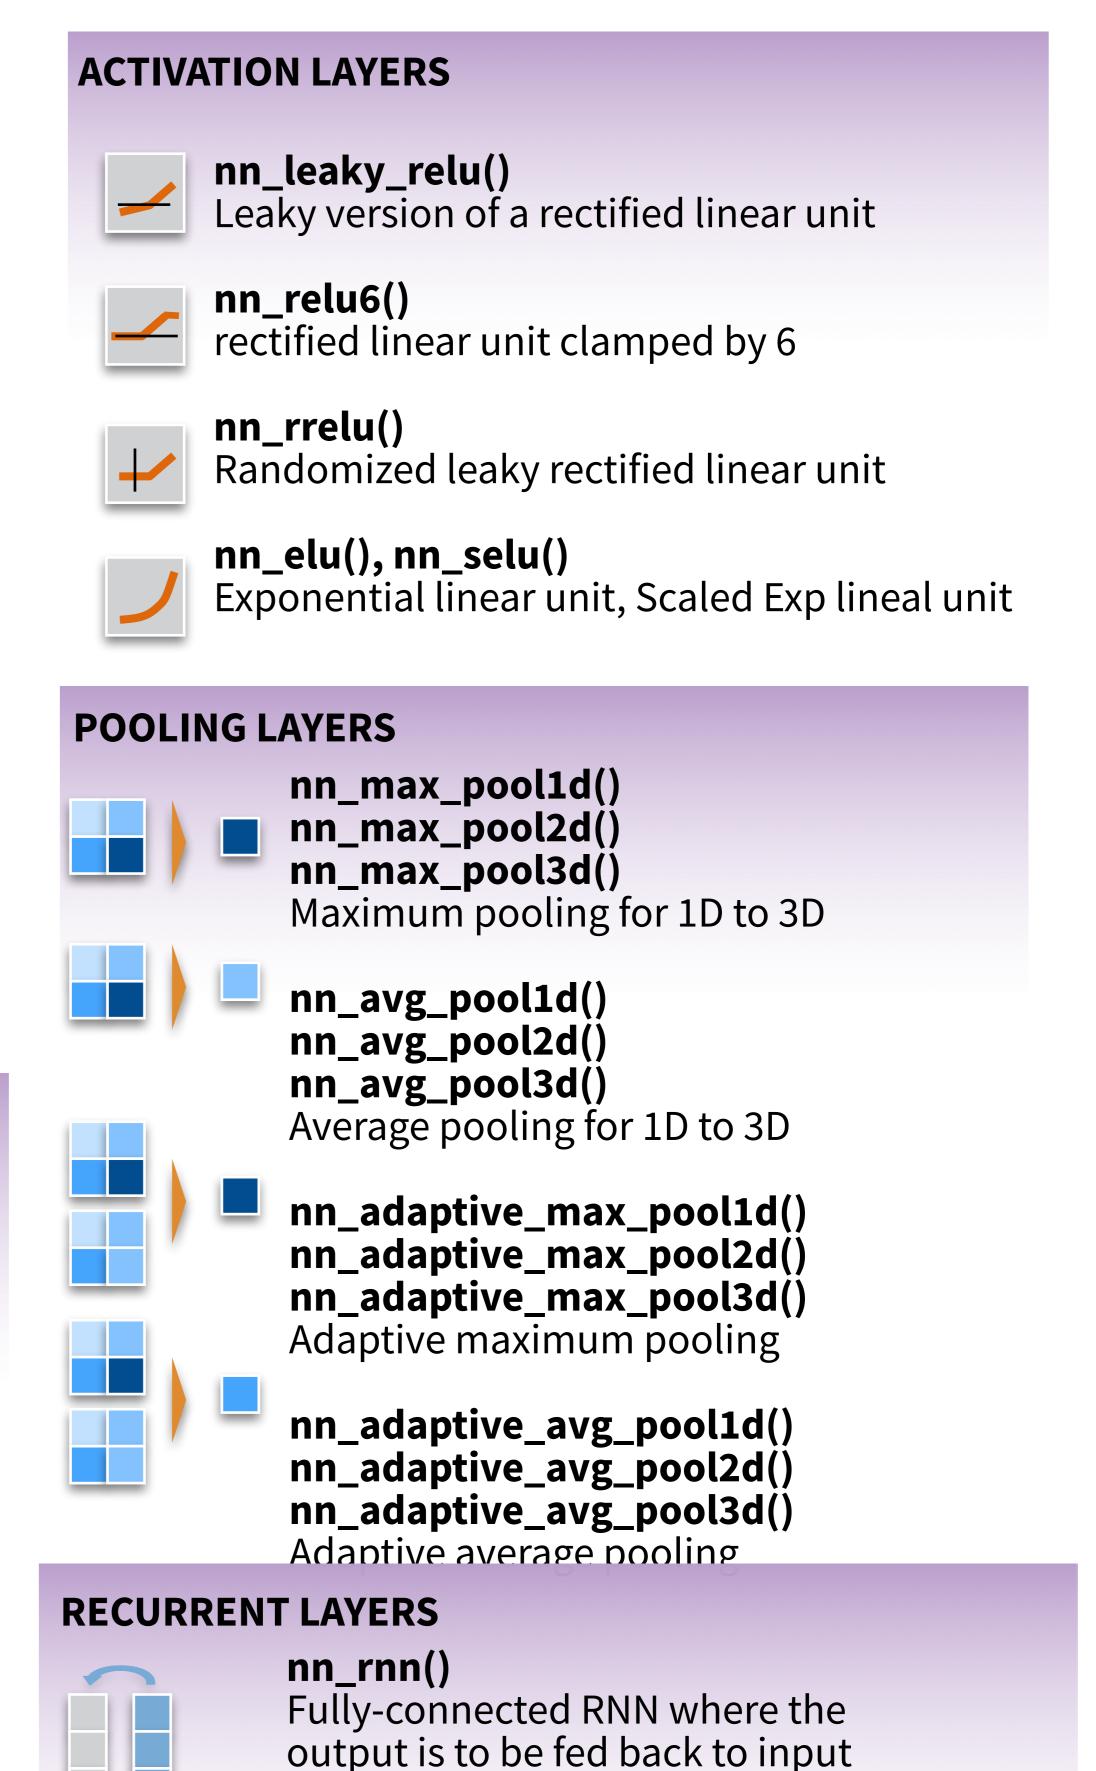

nn\_conv2d() 2D, e.g. spatial convolution over images

nn\_conv\_transpose3d()
Transposed 3D (deconvolution)
nn\_conv3d() 3D, e.g. spatial
convolution over volumes

nnf\_pad()
Zero-padding layer

# Tensor manipulation

# **TENSOR CREATION**

tt <- torch\_rand(4,3,2) uniform distrib.

 $tt \leftarrow torch_randn(4,3,2)$  unit normal distrib.  $tt \leftarrow torch_randint(1,7,c(4,3,2))$  uniform integers within [1,7)

Create a random values tensor with shape

 $tt \leftarrow torch_ones(4,3,2)$ torch\_ones\_like(a)

Create a tensor full of 1 with given shape, or with the same shape as 'a'. Also torch\_zeros, torch\_full, torch\_arange,...

tt\$ndim tt\$dtype tt\$shape [1] 3 [1] 4 3 2 torch\_Float tt\$requires\_grad tt\$device

[1] FALSE torch\_device(type='cpu') Get 't' tensor shape and attributes

tt\$stride() [1] 6 2 1

jump needed to go from one element to the next In each

dimension

 $tt \leftarrow torch_tensor(a,$ dtype=torch\_float(), device= " cuda ") Copy the R array 'a' into a tensor of float on the

← as.matrix(tt\$to(device="cpu ")

# **TENSOR SLICING**

tt[1:2, -2:-1, ] Slice a 3D tensor tt[5:N, -2:-1, ..]

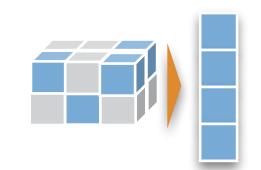

Slice a 3D or more tensor, N for last

tt[1:2, -2:-1, 1:1] tt[1:2, -2:-1, 1, keep=TRUE] Slice a 3D and keep the unitary dim.

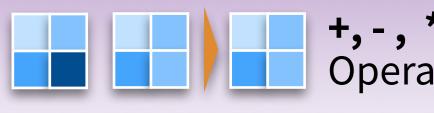

tt[1:2, -2:-1, 1] Slice by default remove unitary dim.

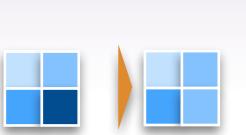

tt[ tt > 3.1] Boolean filtering (flattened result)

#### **TENSOR VALUES OPERATIONS**

Operations with two tensors

\$pow(2), \$log(), \$exp(), \$abs(), \$floor(), \$round(), \$cos(), \$fmod(3), \$fmax(1), \$fmin(3) Element-wise operations on a tensor

\$eq(), \$ge(), \$le() Element-wise comparison

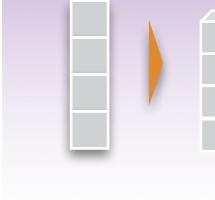

\$to(dtype = torch\_long()) Mutate values type

\$sum(dim=1), \$mean(), \$max() Aggregation functions on a single tensor \$amax()

torch\_repeat\_interleave() Repeats the input n times

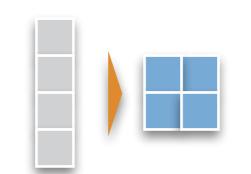

tt\$unsqueeze(1) torch\_unsqueeze(t,1)

"tt" as first dimension

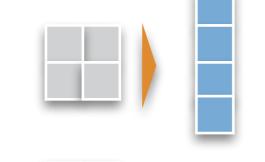

torch\_squeeze(t,1) Remove first unitary dimension to

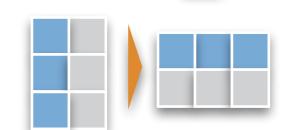

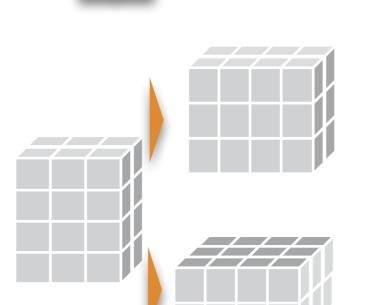

torch\_reshape() \$view()

Change the tensor shape, (tentatively) without with copy or

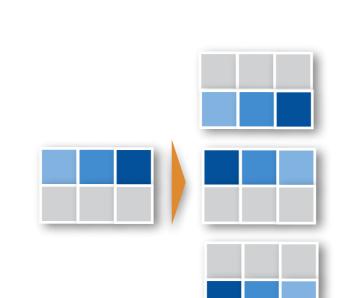

Flattens an input

torch\_movedim(c(1,2,3), c(3,1,2)) move dim 1 to dim 3, dim 2 to 1, dim 3 to 2 torch\_permute(c(3,1,2)) Only provide the target dimension order

**TENSOR CONCATENATION** 

torch\_flip(1)

torch\_flip(2)

torch\_stack()

torch\_cat()

Stack of tensors

Assemble tensors

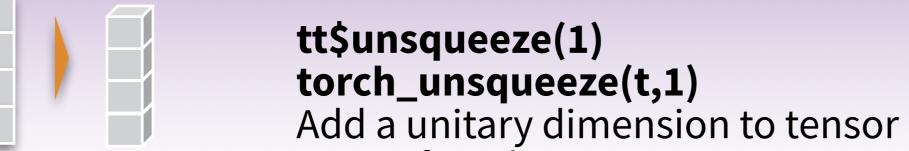

torch\_split(2)

torch\_split(c(1,3,1))

split tensor in sections of size 2

split tensor into explicit sizes

## **TENSOR SHAPE OPERATIONS**

tt\$squeeze(1)

tensor "tt"

torch\_flatten()

torch\_transpose()

torch\_movedim(c(1,2)) switch dimension 1 with 2

flip values along dim 1

both dims torch\_flip(c(1,2))

# The "Hello, World!" of

deep learning

Pre-trained models

models can be used for prediction, feature

Resnet image classification model

without recoding its nn modules in R.

Remove top layer of a model

**IMPORTING FROM PYTORCH** 

This is done in two steps

import torch

model.eval()

import torchvision

extraction, and fine-tuning.

library(torchvision)

**NATIVE R MODELS** 

Torch applications are deep learning models that are

made available alongside pre-trained weights. These

resnet34 ← model\_resnet34(pretrained=TRUE)

resnet34\_headless  $\leftarrow$  nn\_prune\_head(resnet34, 1)

{torchvisionlib} allows you to import a pytorch model

1- instantiate the model in Python, script it, and save it:

torch

TRAINING AN IMAGE RECOGNIZER ON MNIST DATA 504/

# # input layer: use MNIST images

t rchaudio

```
library(torchvision)
train_ds ← mnist_dataset( root = " ~/.cache",
   download = TRUE,
```

torchvision

transform = torchvision::transform\_to\_tensor

train = FALSE,

train\_dl ← dataloader(train\_ds, batch\_size = 32,

test\_dl ← dataloader(test\_ds, batch\_size = 32)

# # defining the model and layers

```
"Net",
initialize = function() {
 self$fc1 \leftarrow nn_linear(784, 128)
 self$fc2 \leftarrow nn_linear(128, 10)
```

torch.jit.save(scripted\_model, "fcn\_resnet50.pt")

2- load and use the model in R: library(torchvisionlib) model ← torch::jit\_load("fcn\_resnet50.pt")

model = torchvision.models.segmentation.

fcn\_resnet50(pretrained = True)

scripted\_model = torch.jit.script(model)

with\_detect\_anomaly()

Provides insight of a nn\_module() behaviour

A callback is a set of functions to be applied at given stages of the training procedure. You can use callbacks to get a view on internal states and statistics of the model during training.

# Troubleshooting

# HELPERS

# Callbacks

test\_ds ← mnist\_dataset( root = " ~/.cache", transform = torchvision::transform\_to\_tensor shuffle = TRUE) net ← nn module( forward = function(x) { x %>% torch\_flatten(start\_dim = 2) %>% self\$fc1() %>% nnf\_relu() %>% self\$fc2() %>% nnf\_log\_softmax(dim = 1)  $model \leftarrow net()$ # define loss and optimizer optimizer ← optim\_sgd(model\$parameters, lr = 0.01) # train (fit) for (epoch in 1:10) { train\_losses  $\leftarrow$  c() test\_losses  $\leftarrow$  c() for (b in enumerate(train\_dl)) { optimizer\$zero\_grad() output ← model(b[[1]]\$to(device = device)) loss ← nnf\_nll\_loss(output, b[[2]]\$to(device = device)) loss\$backward() optimizer\$step() train\_losses ← c(train\_losses, loss\$item()) for (b in enumerate(test\_dl)) { model\$eval() output  $\leftarrow$  model(b[[1]]\$to(device = device)) loss ← nnf\_nll\_loss(output, b[[2]]\$to(device = device)) test\_losses  $\leftarrow$  c(test\_losses, loss\$item()) model\$train()
